Prakhar Pandey

Software Engineer, React & React Native (Web, iOS, Android)

Gurgaon, India | pandey.prakhar5002@gmail.com | www.linkedin.com/in/prakhar-pandey-97532915a | github.com/Prakhar5002 | prakhar5002.github.io

SUMMARY

Frontend and mobile engineer with 5+ years of building React and React Native apps that real people use every day. At Smartworks I work on Workctrl, a workplace app used by 50,000+ people in 5 countries, and I built our support app SW Tickets from an empty repo to both app stores. I like owning a feature from start to finish: the UI, state and API work, native code when it's needed, the release, and keeping an eye on crashes once it's live. On the web side I've built React apps for clients and admin dashboards for content teams.

SKILLS

Languages: JavaScript (ES6+), TypeScript, Kotlin, HTML5, CSS3

React (web): React.js, Redux Toolkit, TanStack Query, React Router, Vite, responsive layouts, WCAG accessibility

React Native: React Native (incl. New Architecture), Expo (EAS Build, OTA updates, Expo Router), native modules, deep linking, push notifications, MMKV

State & APIs: Redux, Redux Toolkit, Zustand, TanStack Query, REST, GraphQL (Apollo, AWS AppSync), Firebase Realtime Database, MQTT

Testing & release: Jest, GitHub Actions CI, Fastlane, Play Store and App Store releases, Sentry, Android vitals, Microsoft Clarity

Security & auth: OAuth 2.0 / OIDC with PKCE (Keycloak), secure token storage, SSL public-key pinning, root and emulator detection, Razorpay payments

Also: Node.js, NestJS, PostgreSQL, Docker, Xcode, Android Studio, OpenCV, AI-assisted development (Claude Code, GitHub Copilot)

EXPERIENCE

Smartworks, Gurgaon **May 2024 – Present**

SDE-II, Frontend & Mobile

- Core engineer on Workctrl (room booking, visitor management, food ordering, ticketing), used by 50,000+ people across 5 countries on iOS and Android. Built the meeting-room booking module end to end, including quick booking, slot management, extend and end, check-in and booking on behalf of clients, plus flexi-seat booking, the activity timeline, in-app ratings and app-wide dark mode.
- Keep the app stable at that scale. The latest release runs at a 0.21% user-perceived crash rate and 0.06% ANR rate on Android vitals, about 5x below Google's 1.09% bad-behaviour threshold.
- Built SW Tickets, the support app used across Smartworks campuses in India, from an empty repository to the Play Store and App Store. The server defines each ticket's statuses and form fields, so operations teams change workflows without an app release. Later moved it from JavaScript to TypeScript, adopted TanStack Query, and added multi-step forms, search and filters with SLA tracking, camera and file uploads, force-update and Sentry monitoring.
- Wrote on-device face recognition with liveness checks (blink, texture and motion) in Kotlin and OpenCV and bridged it into React Native, so meeting-room tablets check people in without a round-trip to the cloud.
- Moved live room-status sync from Kafka to Firebase and changed the app to read only a rolling booking window, cutting Firebase reads by 80–90%. Benchmarked the change and documented it for the team.
- Integrated Keycloak SSO (PKCE login, secure token storage) with a single-flight token refresh that queues requests in flight, which stopped duplicate refresh calls and random logouts. Added OneSignal push notifications that deep-link to the right screen.
- Own payments and app security: an idempotent UPI flow that charges exactly once even when the user switches apps mid-payment, SSL public-key pinning, root and emulator detection, and a native patch for a security library that was crashing the app on launch.
- Led the Expo 53 / React Native 0.79 upgrade and Google's 16 KB page-size requirement on both apps, set up EAS builds with staged OTA channels, and moved release signing to Fastlane.
- Built local-network device discovery (mDNS plus subnet scanning) and Sonoff provisioning for Smart Setup, our smart-building onboarding app. Review most of the team's frontend pull requests and wrote the TypeScript and lint

conventions we follow.

AUMVerse (personal project), aumverse.co **2026 – Present**

Founder and sole engineer

- Building a bilingual (Hindi and English) wellness app on my own: an Expo and React Native app on the New Architecture, a React admin dashboard (Vite, Refine) where editors manage and curate content, and a NestJS, Prisma and PostgreSQL API.
- Built a global audio player with background playback and lock-screen controls, dashboard-curated home screen sections, an in-app update system, and about 1,700 automated tests with CI on every pull request.

Infinity Soft Systems, Noida **Dec 2022 – Mar 2024**

React Native Developer

- Built QU App, a shared-room Spotify voting app where votes sync live between everyone in the room over Firebase. Handled Spotify OAuth token refresh and kept the UI usable under Spotify's rate limits.
- Shipped NoWorriesApp, a mood and worry tracker, to the Play Store. Cut repeat network calls with response caching and request de-duplication, and worked directly with the client.

iFlair Web Technologies, Ahmedabad **Feb 2022 – Nov 2022**

Frontend Developer (React and React Native)

- Built the Clinicards patient-health product for a client in the Netherlands, in React for web and React Native for mobile, on an AWS AppSync GraphQL backend. Built symptom-tracking flows and recovery-trend charts (Victory Native) and made them accessible for non-technical patients, with proper keyboard navigation and focus order. Live on Google Play.

Shantikunj, Haridwar **May 2021 – Jan 2022**

Junior Software Engineer

- Built a video-on-demand and live-streaming app on the YouTube API for an existing audience, my first production React and React Native work.

EDUCATION

Master of Computer Applications (MCA), Dev Sanskriti Vishwavidyalaya, Haridwar 2019 – 2021

Bachelor of Computer Applications (BCA), Dev Sanskriti Vishwavidyalaya, Haridwar 2016 – 2019
